The CARGO CONTROLLER allows to track the transport of goods because it's provided with a GPS satellite receiver and with a GSM modem, which is able to transmit at any time location and status of the system.

The *CARGO CONTROLLER* is the best solution for controlling the transport of huge quantities of goods such as containers, wagons and trucks but can be easily integrated to vans, small trucks and similar.
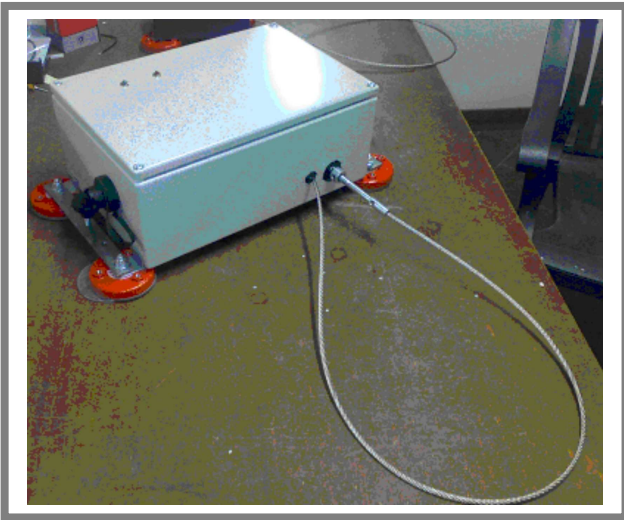

The *CARGO CONTROLLER* is provided with a rechargeable battery that allows an autonomous working for many days and it's therefore provided with a steel security cable that must be used around the handles of the opening doors.

The **CARGO CONTROLLER** can be fixed to the container or through holes on the facility with anchorage on hangers or with anchorage through magnets.

The *CARGO CONTROLLER* **Master** can be linked via radio to remote units (Slave) to allow the tracking of secondary doors.

SECURITY SEALS FOR ALL INDUSTRIES AND TRANSPORTS – TAMPERING PREVENTION SYSTEMS

| CARGO CONTROLLER MASTER	CARGO CONTROLLER SLAVE

The working principle is very simple:
Every time that the pin is pulled out from the plug of a Master or Slave unit, the system transmits to the central (or to any other set mobile number) an SMS, with information about the alarm status of doors opening, date, time and latitude and longitude of the location of the *CARGO CONTROLLER.*

In the same way it's possible to request at any time, through an SMS, the location of the *CARGO CONTROLLER* with the alarm status of doors opening.
The configuration and management of the facilities can be made from mobiles or from control software, installed on the PC.
